1. Payment Authorization

Payment authorization requests must be validated before settlement processing. A transaction may proceed only when the authorization status is approved and the required merchant and payment identifiers are present.

2. Duplicate Payments

The platform must treat a transaction as potentially duplicated when the same merchant transaction identifier is received more than once within the configured duplicate-detection window. Duplicate candidates must be flagged for reconciliation review rather than silently discarded.

3. Failed Authorization

An authorization failure must not be treated as a successful payment. The original authorization result must remain available for reconciliation and support investigation.
