1. Processing Categories

Reconciliation processing handles fee, funding, chargeback, settlement, and deposit records. Each category may arrive through a different processor feed but is normalized into the common reconciliation model.

2. Matching

Matching should use stable transaction and payment references first. Additional attributes such as amount, currency, merchant identifier, and processing date can be used to strengthen a match when the primary reference is unavailable or ambiguous.

3. Exceptions

Records that cannot be matched confidently must be routed to an exception workflow. The system should retain the original record and enough context to explain why the match was not completed.

4. Search

Support users should be able to search reconciliation records using transaction identifiers and other indexed attributes. Search results should expose the source category and relevant processing status.
